LEGEND

- Saltwater intruded area
- Approximate location of inland extent of saltwater intrusion via groundwater flow from the Atlantic Ocean
- Area affected by seepage of brackish water from tidal canals
- Well Field protection zone 1

The approximate inland extent of the salt front is defined by a 250 mg/l isochlor. In areas where there is little or no chloride data available the line has been drawn as a polygon. The narrower the area the greater the certainty as to the location of the salt front. This representation is based upon chloride data collected through February, 2004.
